506-292-6644 | adebowale.712@unb.ca | [linkedin.com/in/waally-xyz](https://www.linkedin.com/in/waally-xyz) | github.com/10xDeVv

Technical Skills

Languages: Java, TypeScript, JavaScript, Python, SQL, VBA

Frameworks: Spring Boot, Next.js, React, FastAPI, JUnit, Vitest

Cloud & Infrastructure: GCP Cloud Run, Docker, GitHub Actions, Kafka, Redis, PostgreSQL, PostGIS, S3-Compatible Storage

Tools & Practices: Git, Maven, Flyway, Testcontainers, Microsoft Access, REST APIs, WebSockets, CI/CD

Experience

Co-Founder & Engineering Lead

Apr. 2026 – Present

Hack Atlantic

Atlantic Canada

- Leading development of HackAtlantic ATS, an end-to-end platform that takes applicants from versioned application forms through review and released decisions to attendee QR passes, while giving organizers and scanner staff one system for event operations.
- Architecting a **Next.js/Clerk and Go/PostgreSQL** system that owns applications, reviewer workflows, decisions, passes, and redemptions through a **48-operation API**.
- Implementing **replay-safe QR passes and checkpoint check-in** with credential hashing, revocation/reissue, serializable redemptions, entitlement controls, and UUID idempotency; conflict paths retry **up to 3 times**.
- Protecting applicant and event data with **Clerk JWT verification**, server-derived roles, exact-origin CORS, owner/role-scoped APIs, and **11 checksum-verified forward migrations**.

Database Systems Developer

Apr. 2026 – Present

Steel Plus Network — Contract, Part-Time

Remote

- Designing an end-to-end Access rebate-management system for **80+ fabricators** and **20+ suppliers** across Canadian and U.S. operations by translating a multi-sheet Excel workflow into a normalized relational schema.
- Implementing supplier-specific rebate payouts through a computed query that joins purchases, contracts, and exchange rates to apply minimum thresholds, USD/CAD conversion, and a **15%** administration fee.
- Building **Access/VBA forms** that reduce data-entry risk for non-technical staff through dropdown-backed relationships and conditional fields, including supplier-specific tonnage tracking.
- Migrating reference data while preserving supplier and regional business rules, then extending the model for parent branches, default currencies, and minimum thresholds.

Founding Software Engineer

Mar. 2026 – Jul. 2026

Spotlight

Canada

- Developed a migration branch that moved a mobile social product from direct Supabase table access to **Spring Boot APIs backed by PostgreSQL**, Flyway migrations, Supabase JWT validation, and server-side user provisioning.
- Centralized evolving product behavior by developing backend modules for profiles, discovery, activities, chat, weekly prompts, notifications, safety, analytics, and MinIO/S3 avatar storage.
- Introduced **STOMP WebSocket chat** with server-owned unread counts, conversation states, moderation flows, and activity rules so core behavior can evolve outside mobile release cycles.

Teaching Assistant

Sep. 2025 – Present

University of New Brunswick — Software Engineering

- Improved students' implementation practices by mentoring software engineering labs on project architecture, version control, agile workflows, maintainability, teamwork, and code quality.
- Reviewed assignments and deliverables with actionable feedback on maintainability, teamwork, source-control hygiene, and code quality.

Database Systems Developer

May 2025 – Aug. 2025

Steel Plus Network — Internship

Remote

- Replaced **13 years** of Excel-based financial and customer workflows with a Microsoft Access system, reducing manual reporting time by **50%+**.
- Migrated, normalized, and optimized thousands of records to create a durable foundation for business reporting and day-to-day operational data management.
- Enabled business teams to manage operational data without spreadsheet maintenance by building interactive forms, reports, dashboards, and macro-supported workflows.

Projects

Wayward | *Spring Boot, Kafka, PostGIS, Redis, OSRM, H3, Next.js, Docker Compose*

- Built a scenic-drive planner that turns a start point, time budget, and preferred vibe into **three** loop options.
- Developed an asynchronous route engine with Spring Boot, **Kafka, OSRM, H3, and PostGIS**: workers build legal road loops, score route corridors against precomputed scenic data, and stream lifecycle updates to a Next.js/Mapbox UI.
- Reduced lookup time in a **1,500-tile scenic-data benchmark** from **3,213 ms** with serial Redis reads to **90 ms** with batched MGET, bulk PostGIS fallback, pipelined cache fills, and a 25,000-entry LRU.
- Tested route quality across **27 fixed scenarios** covering duration fit, option diversity, explanation quality, and strict-vibe failures; the product returns an explicit no-match result rather than a weak route.

LazyDrop | *Next.js, Spring Boot, PostgreSQL, STOMP WebSockets, S3-Compatible Storage, Stripe*

- Built a temporary file-sharing app for QR/code-linked sessions, guest access, and direct browser-to-storage transfers.
- Moved transfer payloads out of the backend: browsers receive **5-minute signed upload URLs**, send files directly to S3-compatible storage, then confirm success before the API saves metadata and broadcasts an update.
- Kept sessions collaborative and controlled with **STOMP live updates**, **8-character** join codes, expiration, participant roles, and server-enforced Guest, Free, Plus, and Pro plan limits.
- Hardened subscription synchronization with Stripe signature verification and a unique **Stripe event ledger**, allowing safe retries through **5-minute** processing leases and a **10-attempt** cap.

WhereDidIApply | *Next.js, TypeScript, Spring Boot, Gmail API, Gemini, GCP Cloud Run*

- Built a privacy-first Gmail job tracker with a searchable, editable dashboard, local caching, and CSV export.
- Kept **Gmail OAuth tokens** in the browser, queried Gmail directly from the client, and returned structured classifications from a stateless Spring Boot service without a server-side email store.
- Built a hybrid rules-and-AI classifier: Gmail filtering and **32** category patterns handle high-signal mail, while **Gemini JSON** resolves ambiguous messages before confidence-based result merging.
- Bound inbox scans with **120-minute** HMAC tokens and server guardrails of **1,500 emails/run**, **200 requests/minute**, and **4 concurrent parses**.

Education

University of New Brunswick

January 2024 – Expected May 2028

Bachelor of Computer Science

- Relevant Coursework: Database Systems, Software Engineering
