EDUCATION

University of New Brunswick

Bachelor of Computer Science, Co-op

January 2024 – Expected May 2028

Fredericton, NB

EXPERIENCE

Co-Founder & Engineering Lead

Apr. 2026 – Present

Hack Atlantic — Student-led Hackathon

Fredericton, NB

- Led an engineering team building a Next.js and Go hackathon platform that received **100+** applications.
- Prevented duplicate checkpoint records during simultaneous QR scans by implementing PostgreSQL row locks and idempotency keys.

Software Developer, Database Systems

May 2026 – Present

Steel Plus Network — Previous Intern, May 2025 – Aug. 2025

Moncton, NB

- Built a C#/.NET Framework bridge around the Access rebate application so automated database changes stayed within designated working copies and received pre-change backups.
- Previously migrated and normalized **1,000+** operational records from legacy Excel financial workflows into Microsoft Access, reducing manual reporting time by over **50%**.

Founding Software Engineer

Mar. 2026 – May 2026

Spotlight

Fredericton, NB

- Proposed and independently executed the migration of a React Native/Expo student platform from direct Supabase data access to a Spring Boot/PostgreSQL backend, centralizing product logic across **35** REST endpoints.

Teaching Assistant

Sep. 2025 – Dec. 2025

University of New Brunswick

Fredericton, NB

- Reviewed lab work and mentored a **100+** student software-engineering cohort on architecture, Git workflows, and implementation quality.

PROJECTS

Wayward | *Spring Boot, Kafka, PostGIS, Redis, H3, OSRM, Next.js*

- Built a scenic-routing platform that generated differentiated driving loops by evaluating legal OSRM corridors against **19** geospatial and road-quality signals.
- Reduced a local 1,500-tile real-Redis lookup benchmark by **97.2%**, from 3.213 s to 90 ms, by replacing serial GETs with one MGET over the same preloaded keys.
- Made asynchronous route generation recoverable after broker failures and worker reassignment using transactional outbox dispatch, Kafka retries, and leases that blocked stale result commits.

Breakpoint | *Rust, React, TypeScript, Mapbox GL, Python*

- Built a five-city transportation-disruption beta with a React/TypeScript geospatial interface and generic Rust API spanning **327,306 modeled directed road edges**.
- Implemented deterministic modeled traffic assignment in Rust with turn-aware routing, exact closure expansion, and explicit convergence and unserved-demand states.
- Made analytical jobs reopenable after restarts by persisting job state and content-addressed results, with lazy generation of route allocations and consequence details.

LazyDrop | *Next.js, Spring Boot, PostgreSQL, STOMP WebSockets, S3-Compatible Storage, Stripe*

- Built a Next.js and Spring Boot file-sharing platform for temporary QR/code-joined rooms, using WebSockets to synchronize transfer state across guest and authenticated sessions.
- Kept file bytes out of the API with two-phase signed uploads to S3-compatible storage while Spring Boot retained authorization, validation, and metadata control after upload confirmation.

TECHNICAL SKILLS

Languages: Java, C#, Go, TypeScript, JavaScript, Rust, Python, SQL

Frameworks: Spring Boot, .NET Framework, Next.js, React

Data & Infrastructure: PostgreSQL, PostGIS, Kafka, Redis, Docker, Terraform, S3-Compatible Storage

Engineering: REST APIs, WebSockets, GitHub Actions, CI/CD, Git, Automated Testing
