506-292-6644 | adebowale.712@unb.ca | [linkedin.com/in/waally-xyz](https://www.linkedin.com/in/waally-xyz) | github.com/10xDeVv

Technical Skills

Languages: Java, Go, TypeScript, JavaScript, Rust, SQL, VBA

Frameworks: Spring Boot, Next.js, React, Clerk, MapLibre GL

Data & Infrastructure: PostgreSQL, PostGIS, Kafka, Redis, Docker, S3-Compatible Storage, GCP Cloud Run

Tools & Practices: Git, Maven, Flyway, Microsoft Access, REST APIs, WebSockets, CI/CD

Experience

Co-Founder & Engineering Lead

Apr. 2026 – Present

Hack Atlantic

Fredericton, NB

- Led a team of engineers by organizing tasks, reviewing pull requests, and guiding delivery of an **ATS platform** that managed **100+ applicants** from submission through QR check-in.
- Architected a Next.js UI and **Go/PostgreSQL** API boundary that kept application state, authorization, decisions, and database access server-side while Clerk provided identity.
- Designed revocable, hash-stored claim and QR credentials with **atomic checkpoint redemption** and explicit lifecycle transitions.

Database Systems Developer

Apr. 2026 – Present

Steel Plus Network

Remote, Moncton, NB

- Designing a normalized **Microsoft Access** rebate-management system for a fabricator-by-supplier workflow spanning Canadian and U.S. members.
- Building calculated rebate queries and **Access/VBA** workflows that connect contracts, purchases, and exchange rates to supplier-specific rates, thresholds, CAD/USD conversion, and remittance-style payouts.

Founding Software Engineer

Mar. 2026 – Jul. 2026

Spotlight

Canada

- Built a **Spring Boot** migration branch for a React Native student-connection app, moving application data from direct Supabase table access to backend-owned APIs while retaining Supabase Auth.
- Implemented server-owned **STOMP WebSocket chat** with unread counts, conversation state, moderation, and activity rules alongside backend domains for profiles, discovery, activities, prompts, notifications, safety, and analytics.

Teaching Assistant

Sep. 2025 – Present

University of New Brunswick — Software Engineering

Fredericton, NB

- Mentor Introduction to Software Engineering lab students on project architecture, version control, Agile workflows, and implementation quality.

Database Systems Developer

May 2025 – Aug. 2025

Steel Plus Network — Internship

Remote, Moncton, NB

- Replaced legacy Excel financial and customer workflows with **Microsoft Access**, reducing manual reporting time by **more than 50%**.
- Migrated, normalized, and optimized **1,000+ records** for business reporting and day-to-day operational data management.
- Built interactive forms and reports that let business teams manage operational data in the database rather than maintain spreadsheets.

Projects

Breakpoint | Rust, React, TypeScript, MapLibre GL, Cargo

- Developed a private road-closure explorer that let analysts select a road segment and inspect modeled changes to travel and essential-service access.
- Built a **deterministic Rust network-analysis engine** with immutable directed graphs, turn-aware closures, SHA-256-pinned identities, FIFO-aware routing, and exact rational Frank-Wolfe reference assignment.
- Hardened model results through content-addressed storage, hash-validated replay, atomic file publication, and explicit failure states that withhold comparisons for non-converged runs.

Wayward | *Spring Boot, Kafka, PostGIS, Redis, OSRM, H3, Next.js, Docker Compose*

- Built Wayward, a scenic-driving-loop planner that combines **OSRM** road geometry and H3-sampled environmental data to turn a start point, time budget, and vibe into three route profiles.
- Implemented progressive delivery through a **Spring Boot/Kafka** route pipeline that publishes an exact primary route before full details. The Next.js UI rejects stale updates and falls back to bounded polling.
- Optimized the **1,500-tile scenic-cache lookup** with a local LRU, one Redis MGET, bulk SQL misses, and pipelined fills. A real-Redis benchmark measured **90 ms vs. 3.213 s** for batch versus serial reads.

LazyDrop | *Next.js, Spring Boot, PostgreSQL, STOMP WebSockets, S3-Compatible Storage, Stripe*

- Built LazyDrop, a real-time file-sharing platform for temporary rooms joined by QR code or short link, using **two-phase signed uploads** to transfer files directly to object storage.
- Implemented per-session **STOMP/SockJS WebSockets** for peer, file, note, thumbnail, and session-lifecycle updates, publishing events after transaction commit and de-duplicating file state in React.
- Hardened Stripe subscription processing with signature validation, a persistent **idempotent webhook ledger**, transactionally claimed leases, and a bounded **10-attempt retry policy**.

WhereDidIApply | *Next.js, TypeScript, Spring Boot, Gmail API, Gemini, GCP Cloud Run*

- Built WhereDidIApply, a **Gmail job tracker** that turns inbox messages into a searchable dashboard.
- Designed a privacy-conscious Gmail flow that keeps OAuth tokens in browser state, calls Gmail directly, and provides **no server-side email storage**.
- Implemented a Spring Boot hybrid email parser with **32 deterministic classification patterns**, structured Gemini JSON extraction, and confidence-based result merging.

Education

University of New Brunswick

January 2024 – Expected May 2028

Bachelor of Computer Science

- Relevant Coursework: Database Systems, Software Engineering
